Scope and policy of the journal

Agricultural Science and Technology /AST/ – an International Scientific Journal of Agricultural and Technology Sciences is published in English in one volume of 4 issues per year, as a printed journal and in electronic form. The policy of the journal is to publish original papers, reviews and short communications covering the aspects of agriculture related with life sciences and modern technologies. It will offer opportunities to address the global needs relating to food and environment, health, exploit the technology to provide innovative products and sustainable development. Papers will be considered in aspects of both fundamental and applied science in the areas of Genetics and Breeding, Nutrition and Physiology, Production Systems, Agriculture and Environment and Product Quality and Safety. Other categories closely related to the above topics could be considered by the editors. The detailed information of the journal is available at the website. Proceedings of scientific meetings and conference reports will be considered for special issues.

Submission of Manuscripts

All manuscript written in English should be submitted as MS-Word file attachments via e-mail to ascitech@uni-sz.bg. Manuscripts must be prepared strictly in accordance with the detailed instructions for authors at the website

<http://www.uni-sz.bg/ascitech/index.html> and the instructions on the last page of the journal. For each manuscript the signatures of all authors are needed confirming their consent to publish it and to nominate on author for correspondence. They have to be presented by a submission letter signed by all authors. The form of the submission letter is available upon request from the Technical Assistance or could be downloaded from the website of the journal. All manuscripts are subject to editorial review and the editors reserve the right to improve style and return the paper for rewriting to the authors, if necessary. The editorial board reserves rights to reject manuscripts based on priorities and space availability in the journal.

Internet Access

This journal is included in the Trakia University Journals online Service which can be found at www.uni-sz.bg.

Abstract. In the following work possibilities to monitor the acid coagulation dynamics by rotational viscometer are discussed. There is established suitable speed of rotation of the cylinder, in line with the delicate structure of the gel. The time to achieve the isoionic point in the acid coagulation of milk can be determined by changing the viscosity. The obtained results give grounds to assert that the viscometers cannot be used alone for the detailed monitoring of acid coagulation. Viscometers can be used as the reference method for monitoring changes of dynamic viscosity of milk during acid coagulation and determining the point of gelation. To establish the parameters of acid coagulation dynamics titratable acidity ($^{\circ}T$), pH and lactic acid accumulation on milk (%) were followed.

Keywords: acid coagulation, viscometers, milk

Abbreviations: TA – titratable acidity, LA – lactic acid

Introduction

Acid coagulation is the critical first step in the manufacturing of yoghurt products. This process of acid formation has a significant influence on texture, microstructure and rheology of yogurt, contributing to the overall sensory and visual perception by the consumer. Acid gels may be considered as a protein network composed of demineralized casein micelles formed as a result of gradual fermentation of lactose by lactic acid bacteria (Horne, 1999). As a result of gradual accumulation of lactic acid, respectively lower pH, physical and chemical changes in micellar structure of casein are observed. These changes are especially significant at pH 5.3 ÷ 5.0 where the basic structural element in casein micelles colloidal calcium phosphate (CCP) is dissolved completely in the liquid phase (Dalgleish, 1989; Gastaldi, 1996). As a consequence of these processes changes in rheological characteristics of milk (viscosity, elasticity, etc.) are established due to destabilization and transformation of micelles which phosphorous-calcium bounds are destroyed.

The rheological properties of milk during acid coagulation can be assessed by a range of rheological techniques such as small amplitude oscillatory rheometers, large amplitude oscillatory shear, penetrometers, rotational viscosimeters (Benezech and Maingonnat, 1994; Velez-Ruiz and Barbosa Canovas, 1997). Combination between rheological techniques and other instrumental methods may be used to monitor the gel formation phase, as well as the impact of subsequent processing steps on the properties of the gel.

The objective of this study is to establish a possibility for monitoring the structure formation during acid coagulation of milk by using different speeds of rotation of the cylinder of rotational viscometer.

Material and methods

Preparation of yogurt

In this study low-fat cow's milk 1.5% is used. The pasteurized milk bases is cooled to incubation temperature 45°C, inoculated with lactic starter (*Lactobacillus delbrueckii ssp.bulgaricus* u *Streptococcus thermophilus*), poured into 400 ml plastic containers and incubated at 45°C in the conditions of water bath. With the information and archiving system Microsyst – MS Data Logger Network 3.02 data are recorded in real time to reach pH 4.6 (the pH end point) and T ($^{\circ}C$) (Figure 1). Titratable acidity (represented as % lactic acid) and dynamic viscosity (Pa.s) determination were conducted at fixed time intervals during the incubation of yogurt.

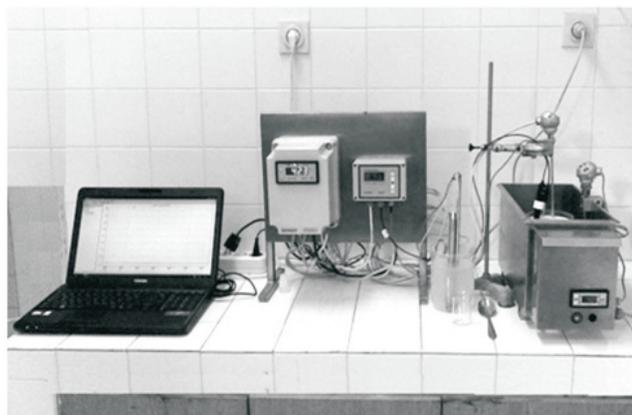

Figure 1. Laboratory system for control and archiving.

Determination of titratable acidity

Titratable acidity is determined at intervals of 20 min by double titration of milk samples of 10 ml with 0.1 n NaOH using

* e-mail: petya_boyanova86@yahoo.fr

phenolphthalein as indicator. Results are represented as lactic acid (%) Using the current value for TA (TA_n) and initial (TA_0) the amount of lactic acid (LA,%) ($CH_3-CHOH-COOH$, MW = 90) is obtained using the following formula:

$$LA = (\Delta TA \times MW \times n) / 1000, \%$$

where:

LA – lactic acid, (%);

ΔTA – variation of titratable acidity, ($^{\circ}T$);

MW – molecular weight of lactic acid, Da;

0.009 – conversion coefficient of Thorner degrees in lactic acid;

n – normality of NaOH.

Variation of TA (ΔTA) is obtained as the difference between the current value (TA_n) and initial value (TA_0) measured after the addition of starter culture (TK_0).

$$\Delta TA = TA_n - TA_0, ^{\circ}T$$

For $n = 0.1$ is obtained:

$$LA = \Delta TA \times 0.009, \%$$

Measurement of viscosity

Dynamic viscosity (Pa.s) is measured using a rotational viscometer model Reotest 2.1, (VEB MLW Prüfgeräte-Werk Medingen, Germany) with measuring cylinder type N, which is used to measure the viscosity of light liquids. In dealing with this kind of measuring cylinder the required amount of sample is 11 ml, the samples examined must show a viscosity in the range of $1 \div 200\,000$ mPa.s, applied shear stress (τ_r) is in the range of $1,6 \div 32$ Pa and velocity shear (Dr) from 0.15 to 1310 s^{-1} . At the measuring tube 11 ml of sour milk were placed. Viscosity measurements are performed in sour milk at the incubation temperature $45^{\circ}C$, which is maintained by a circulating water bath. Every 20 min, it is taking the values of $\alpha = (0 \dots 100)$ which are recorded from the indicator device. Viscosity measurements are made at four speeds of cylinder shown in Table 1.

Table 1. Rotation speeds of the cylinder type N.

Measuring cylinder	Step of speed (rate of gear)	Rotation speed min^{-1}
N	1 bd	0.28
	2 bd	0.50
	3 bd	0.83
	4 bd	1.50

For each speed dynamic viscosity is calculated by the following equation:

$$\eta = (\tau_r / D_r) \times 100, (Pa.s)$$

where:

D_r – shear rate, (s^{-1});

τ_r - shear stress, (10^{-1} Pa).

Shear stress is calculated by the formula:

$$\tau_r = z \times \alpha, (10^{-1} Pa)$$

where:

z - constant of the cylinder, (10^{-1} Pa). Constant of cylinder type N has a value of $3.44(10^{-1} Pa)$;

α – recorded value of the indicator device (0...100);

Results and discussion

Using spline-function of the program SigmaPlot (Version 12.0) was carried out connecting the intermediate values to those

obtained in the experiment. The accumulation of lactic acid during acid coagulation (Figure 2) is realized by about 0.05 % to 20 min and for the period of 160 min its amount reached 0.42 % lactic acid. The resulting coefficient of correlation $R = 0.0026$ obtained by linear regression equation of the type $y = y_0 + ax$ at significance level $P < 0.0001$ showing the linear character of the process.

Using the rotation speed of the measuring cylinder 0.28 min^{-1}

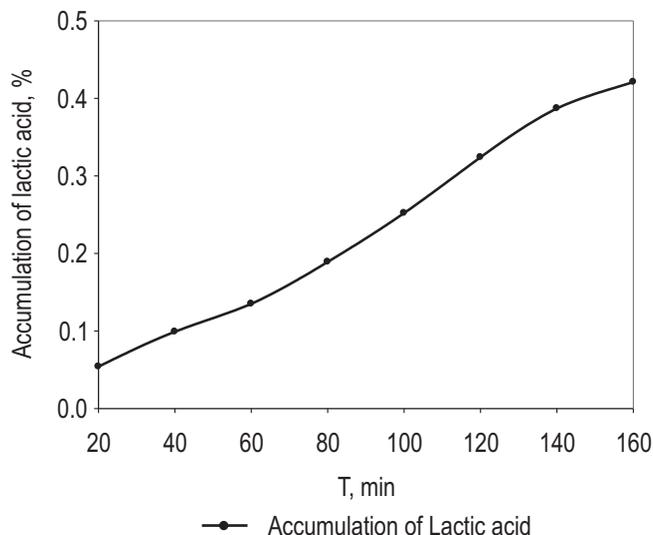

Figure 2. Accumulation of lactic acid (%) during lactic acid fermentation.

(Figure 3) initial changes in the viscosity of milk at $pH = 5.5$ are established. These changes are not accompanied by the visible coagulation typical for $pH = 5.3 \div 5.1$. After achieving $pH = 5.4$ no change is observed in the values of the viscosity due to the formation of protein aggregates on the surface of the cylinder, leading to blockage of his movement. Initial changes in viscosity cannot be established by the higher speeds of rotation of the cylinder (0.50 , 0.83 and 1.50 min^{-1}) (Figure 4, 5, 6). The higher speed gives the possibility to establish the time of initial coagulation at $pH = 5.3$ and inability to follow the end of the coagulation at $pH = 4.6$ due to their destructive effect on the gel formations.

At a speed of rotation of the cylinder 0.50 min^{-1} after reaching $pH = 5.1$ a phase without change in viscosity is established due to the presence of the above-mentioned reason. At a speed of $0,83$ min^{-1} , in order to obtain particles with a size comparable to the distance between the working cylinders, we can properly monitor the process of acid coagulation. Due to the higher speed compared to the speed, the study of which is shown in Figures 3 and 4, aggregation particles that reach the maximum size get destroyed, those of which the size is comparable to the distance between the working cylinder and the recipient, slowing rotation of the rheometer cylinder body, their destruction leads to uneven progress of received data for the dynamic viscosity.

At a speed of $1,50$ min^{-1} , after reaching $pH = 5.1$ the gel formed is destroyed, but because of the higher speed particles are dispersed evenly. This is the reason for dynamic viscosity to remain at $pH = 4,7 \div 4,8$, then the spinning cylinder moving with greater speed times dispersed coagulum to smaller particle size, as shown by a decrease in the values of dynamic viscosity. The maximum value for dynamic viscosity is reduced by increasing the speed of rotation of the working cylinder $23000 \cdot 10^{-4}$ Pa.s to $4300 \cdot 10^{-4}$ Pa.s. This means that the destruction of the acid gel at a speed $1,50$ min^{-1} began at considerably earlier stage of the slower speeds.

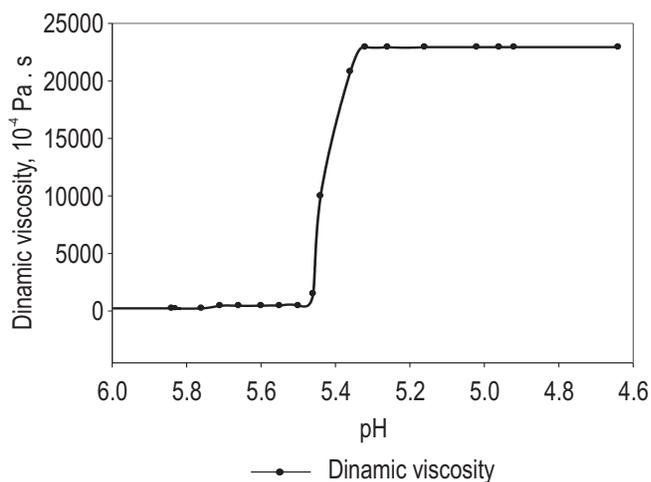

Figure 3. Change of viscosity with rotational speed of the cylinder 0.28 min^{-1} .

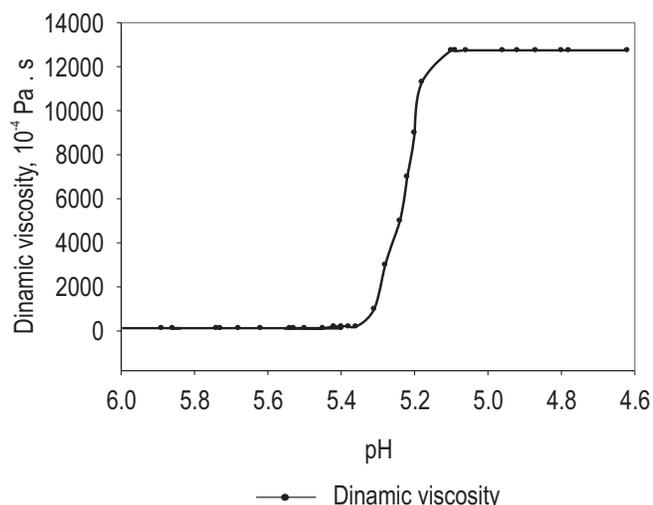

Figure 4. Change of viscosity with rotational speed of the cylinder 0.50 min^{-1} .

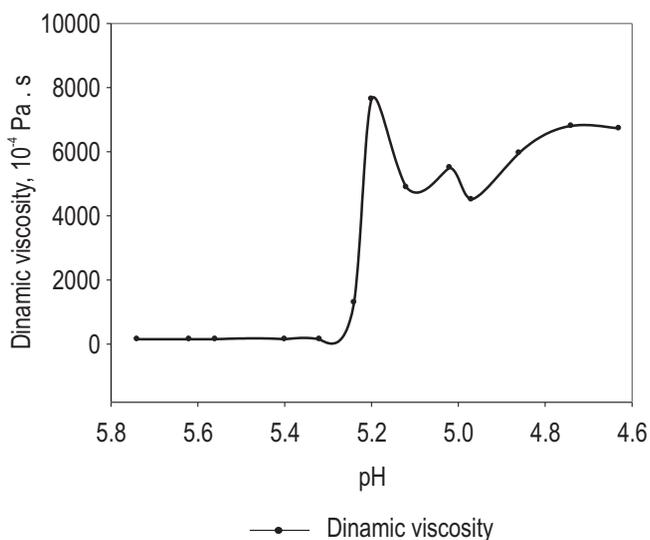

Figure 5. Change of viscosity with rotational speed of the cylinder 0.83 min^{-1} .

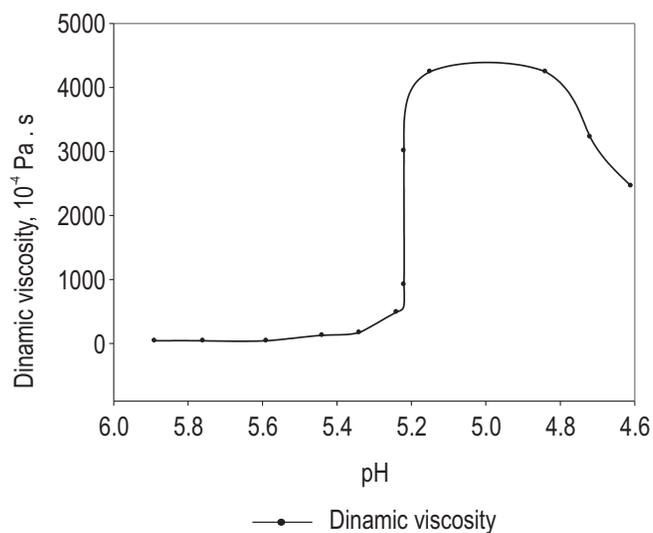

Figure 6. Change of viscosity with rotational speed of the cylinder 1.50 min^{-1} .

Conclusion

Application of low speed 0.28 min^{-1} cylinder is suitable for establishing the initial changes in structure formation during acid coagulation of milk but is not suitable for capturing the end time of gel formation. Use of higher speeds (0.50 ; 0.83 and 1.50 min^{-1}) gives adequate indication of the formation of aggregates but as a result of their destructive effect on the gel, the process of coagulation has to be monitored.

Future research will follow the acid coagulation using a combination between speed of rotation of the measuring cylinder. The aim of shifting into another gear when it reaches a certain pH is to ignore the influence of protein aggregates resulting from acid coagulation.

Instruction for authors

Preparation of papers

Papers shall be submitted at the editorial office typed on standard typing pages (A4, 30 lines per page, 62 characters per line). The editors recommend up to 15 pages for full research paper (including abstract, references, tables, figures and other appendices)

The manuscript should be structured as follows: Title, Names of authors and affiliation address, Abstract, List of keywords, Introduction, Material and methods, Results, Discussion, Conclusion, Acknowledgements (if any), References, Tables, Figures.

The title needs to be as concise and informative about the nature of research. It should be written with small letter /bold, 14/ without any abbreviations.

Names and affiliation of authors

The names of the authors should be presented from the initials of first names followed by the family names. The complete address and name of the institution should be stated next. The affiliation of authors are designated by different signs. For the author who is going to be corresponding by the editorial board and readers, an E-mail address and telephone number should be presented as footnote on the first page. Corresponding author is indicated with *.

Abstract should be not more than 350 words. It should be clearly stated what new findings have been made in the course of research. Abbreviations and references to authors are inadmissible in the summary. It should be understandable without having read the paper and should be in one paragraph.

Keywords: Up to maximum of 5 keywords should be selected not repeating the title but giving the essence of study.

The introduction must answer the following questions: What is known and what is new on the studied issue? What necessitated the research problem, described in the paper? What is your hypothesis and goal?

Material and methods: The objects of research, organization of experiments, chemical analyses, statistical and other methods and conditions applied for the experiments should be described in detail. A criterion of sufficient information is to be

possible for others to repeat the experiment in order to verify results.

Results are presented in understandable tables and figures, accompanied by the statistical parameters needed for the evaluation. Data from tables and figures should not be repeated in the text.

Tables should be as simple and as few as possible. Each table should have its own explanatory title and to be typed on a separate page. They should be outside the main body of the text and an indication should be given where it should be inserted.

Figures should be sharp with good contrast and rendition. Graphic materials should be preferred. Photographs to be appropriate for printing. Illustrations are supplied in colour as an exception after special agreement with the editorial board and possible payment of extra costs. The figures are to be each in a single file and their location should be given within the text.

Discussion: The objective of this section is to indicate the scientific significance of the study. By comparing the results and conclusions of other scientists the contribution of the study for expanding or modifying existing knowledge is pointed out clearly and convincingly to the reader.

Conclusion: The most important consequences for the science and practice resulting from the conducted research should be summarized in a few sentences. The conclusions shouldn't be numbered and no new paragraphs be used. Contributions are the core of conclusions.

References:

In the text, references should be cited as follows: single author: Sandberg (2002); two authors: Andersson and Georges (2004); more than two authors: Andersson et al. (2003). When several references are cited simultaneously, they should be ranked by chronological order e.g.: (Sandberg, 2002; Andersson et al., 2003; Andersson and Georges, 2004).

References are arranged alphabetically by the name of the first author. If an author is cited more than once, first his individual publications are given ranked by year, then come publications with one co-author, two co-authors, etc. The names of authors, article and journal titles in the Cyrillic or alphabet different from Latin, should be transliterated into Latin and article titles should be translated into English. The original language of articles and books translated into English is indicated in

parenthesis after the bibliographic reference (Bulgarian = Bg, Russian = Ru, Serbian = Sr, if in the Cyrillic, Mongolian = Mo, Greek = Gr, Georgian = Geor., Japanese = Ja, Chinese = Ch, Arabic = Ar, etc.)

The following order in the reference list is recommended:

Journal articles: Author(s) surname and initials, year. Title. Full title of the journal, volume, pages. Example:

Simm G, Lewis RM, Grundy B and Dingwall WS, 2002. Responses to selection for lean growth in sheep. *Animal Science*, 74, 39-50

Books: Author(s) surname and initials, year. Title. Edition, name of publisher, place of publication. Example:

Oldenbroek JK, 1999. Genebanks and the conservation of farm animal genetic resources, Second edition. DLO Institute for Animal Science and Health, Netherlands.

Book chapter or conference proceedings: Author(s) surname and initials, year. Title. In: Title of the book or of the proceedings followed by the editor(s), volume, pages. Name of publisher, place of publication. Example:

Mauff G, Pulverer G, Operkuch W, Hummel K and Hidden C, 1995. C3-variants and diverse phenotypes of unconverted and converted C3. In: *Provides of the Biological Fluids* (ed. H. Peters), vol. 22, 143-165, Pergamon Press. Oxford, UK.
