### **Scope and policy of the journal**

Agricultural Science and Technology /AST/ – an International Scientific Journal of Agricultural and Technology Sciences is published in English in one volume of 4 issues per year, as a printed journal and in electronic form. The policy of the journal is to publish original papers, reviews and short communications covering the aspects of agriculture related with life sciences and modern technologies. It will offer opportunities to address the global needs relating to food and environment, health, exploit the technology to provide innovative products and sustainable development. Papers will be considered in aspects of both fundamental and applied science in the areas of Genetics and Breeding, Nutrition and Physiology, Production Systems, Agriculture and Environment and Product Quality and Safety. Other categories closely related to the above topics could be considered by the editors. The detailed information of the journal is available at the website. Proceedings of scientific meetings and conference reports will be considered for special issues.

### **Submission of Manuscripts**

All manuscript written in English should be submitted as MS-Word file attachments via e-mail to [ascitech@uni-sz.bg](mailto:ascitech@uni-sz.bg). Manuscripts must be prepared strictly in accordance with the detailed instructions for authors at the website <http://www.uni-sz.bg/ascitech/index.html> and the instructions on the last page of the journal. For each manuscript the signatures of all authors are needed confirming their consent to publish it and to nominate an author for correspondence. They have to be presented by a submission letter signed by all authors. The form of the submission letter is available upon request from the Technical Assistance or could be downloaded from the website of the journal. All manuscripts are subject to editorial review and the editors reserve the right to improve style and return the paper for rewriting to the authors, if necessary. The editorial board reserves rights to reject manuscripts based on priorities and space availability in the journal.

### **Subscriptions**

Agricultural Science and Technology is published four times a year. The subscription price for institutions is 80 € and for personal subscription 30 € which

include electronic access and delivery. Subscription run for full calendar year. Orders, which must be accompanied by payment may be sent direct to the publisher:

Trakia University  
Faculty of Agriculture, Bank account:  
UniCredit Bulbank,  
Sofia BIC: UNCRBGSF

IBAN: BG29UNCR76303100117681

## Productive performance and quality of essential oil from oil bearing rose (*Rosa damascena* Mill) for use of oxadiargyl

D. Angelova \*

Institute of Roses, Essential and Medical Cultures, 49 Osvozhdenie, 6100 Kazanlak, Bulgaria

**Abstract.** The survey was conducted during the period 2009 - 2010 at IREMC - Kazanlak. The experiment is set in four iterations at a plantation of roses /*R. damascena* Mill./ We examined herbicide efficacy and selectivity of oxadiargyl /Raft 400 SC/ applied as soil herbicide before vegetation at a dose of 1,2 l/ha and 1,5 l/ha. It was found that a higher level of performance against annual and perennial weeds is Raft 400 SC applied at a dose of 1,5 l/ha. The herbicide has excellent selectivity for the oil-bearing rose. When using the two concentrations positive and statistically proven differences in production traits were found at  $P= 5\%$  and  $P= 1$ .

**Keywords:** oil-bearing rose, weeds, herbicide, efficiency, selectivity

### Introduction

*Rosa damascena* Mill. is emblematic for Bulgaria, the area of which in recent years reached 35,000 da (Kovacheva et al., 2010). At present, the population of Kazanlak rose which is grown occupies almost 100% of the areas in the country. Institute of Roses, Essential and Medical Cultures (IREMC), Kazanlak maintain shortlisted Bulgarian varieties, characterized by good economic indicators and events characterized in terms of adaptability and stability of yield (Kovacheva et al., 2010). It was found that some varieties have a good productive capacity under less favorable conditions of production while others have lower adaptive capacity. Despite the good performance of our species and populations, the main problem that rose-oil producers face is the minimum number of approved plant protection products, including herbicides. Against the background of the other crops, the areas with oil-bearing roses are relatively small and companies importing pesticides have no interest to pay the charge on their biological testing. This puts rose production in disadvantage, which reports a significant yields decrease in recent years. Not always the removal of chemical control is successful but in most cases it is associated with increased cost.

The purpose of this study is to determine the impact of herbicide Raft 400 SC at different concentrations on oil-bearing rose productive quality.

### Material and methods

The survey was conducted during the period 2009 - 2010 at IREMC - Kazanlak. The experiment is embedded in a block method of Fischer in four repeats with size of the test area 25 m<sup>2</sup>, in flowering plantation of Kazanlak rose (*R. damascena* Mill.). Tested were the following options: Control - no herbicide, Raft 400 SC (400 g/l oxadiargyl) - 1,2 l/ha and 400 Raft SC - 1,5 l/ha. Introduction of herbicides is done in early spring season before rose and weed growing. The efficacy of the herbicide was recorded on the 20th and

40th day after treatment. The species composition of weeds was recorded by the eye-measure method and the extent of weeding - by quantitative method. The selectivity of herbicide was report on 10-ballroom scale EWRS (in ball 1 no damage to the crop, and in ball 9 – the crop is completely destroyed). Reported is the number of flowers from a bush and the daily yield of flowers by variations and repeats, equivalent to 1 ha.

The content of essential oil was determined by water-steam distillation-type calipers Klevendzhar in options and repetitions, each of which is presented in three samples of 200 g fresh flower.

Determination of the main constituents of essential oils is performed on a gas chromatograph PYE UNICAM on the following operating conditions: Capillary column – EKONO – CAP™ EC™ – 1,30 m length, inner diameter 0,32 mm.™. Oven temperature: temperature programming from 70 °C to 230 °C at a rate of increase in 8 °C / min. Injector temperature: 300 °C, detector temperature: 300 °C, carrier gas: hydrogen injection, volume: 0,1 µl, velocity - winner: 1,3 ml/min. In chromatograms obtained to identify representative and distinctive ingredients given in BS ISO 9842 – 2004. The precision of the results to determine the peaks using pure substances.

The results were statistically processed, and the differences between the variants included in the study were identified through Single - analysis of variance (ANOVA) (Zapryanov and al., 1978).

### Results and discussion

The results obtained that render an account of weed infestation after the introduction of herbicides are given in Table 1. The experimental area is a natural weeding background of mixed type, dominant weeds are annual broadleaf species - *Amaranthus retroflexus* L., *Chenopodium album* L., *Galinsoga parviflora* Cav., *Polygonum aviculare* L., *Datura stramonium* L.. Their number average for the period is 88 pcs./m<sup>2</sup>. Annual grains are represented by *Setaria glauca* L., perennial species - *Convolvulus arvensis* L.,

\* e-mail: desita7706@abv.bg

*Cirsium arvense* L., *Cardaria draba* L. and *Cynodon dactylon* L. also have high density - 48 pcs./m<sup>2</sup>.

Consideration of weeds shows that options with Raft 400 SC (400 g/l oxadiargyl) in both tested doses reported 93% efficacy against annual broadleaf weeds such as *Amaranthus retroflexus* L., *Chenopodium album* L., *Galinsoga parviflora* Cav. and others. In perennial weeds the rate of destruction varies from 83-86 in different variants. From perennial broadleaf species much more strongly affected and suppressed in their development bindweed. Total destroyed weeds to control in adjacent options, Raft 400 SC administered dose of 1,2 l/ha was 88% with the higher dose - 1,5 l/ha remained roughly the same over the years - 92%. Raft 400 SC applied in doses 1,2 and 1,5 l/ha exhibits excellent selectivity to oil-bearing rose (score 1 on scale EWRS).

Single – Anova analysis showed differences in the productive characteristics of different variants. For the year 2009 (Table 2) no statistically significant differences in the variants were found. Between repetitions significantly larger variations have been obtained and the differences are from 700 kg/ha (var.1) to 1420 kg/ha (var.2). This is due to climatic conditions during the harvesting

period – low relative humidity and high average temperature which had a negative impact on the development of the bushes and caused shedding of many flower buds. For a variant with a lower dose of herbicide more flowers are formed on a bush, but with lower average weight of 1 flower - 2 gr, against 2,3 gr with Raft 400 SC.

The results for the year 2010 show certain differences between the average yield of flower and essential oil, for both version of the herbicide (Table 3). In relative terms, however, excess production of flower is only 9% in variants with herbicides compared to the control variant. This indicates that under certain conditions, incl. climatic factors, the plant adaptive capacity of the untreated control is increased overcoming the negative impact of weeds. Indicators of essential oil content and number of flowers on a bush confirm the finding.

As regards the composition of essential oil, all variants showed minor deviations from the standard BDS ISO 9842-2004, which are beyond all bounds, due to the influence of different factors that are not object of this study. Variants involving herbicide showed a higher alcohol content compared to control variant. They also reported a higher content of microelements cis and trans-rose oxide, which are

**Table 1.** Efficiency and selectivity of herbicides in rose oil

Variants	Weeds number per m <sup>2</sup>					Selectivity by EWRS
	Annual monocotyledons	Annual dycotyledons	Total annual	Perennial	Total	
Untreated control	17	88	105	43	148	1

an important part of the smell qualities of essential oil (Table 4).

## Conclusion

Oxadiargyl (Raft 400 SC) at tested doses shows good efficacy against sensitive annual and some perennial weeds. The studied herbicides preparation exhibits excellent selectivity for oil-bearing rose. The application of the herbicide in both variants proved to have a positive influence on the overall yield of flower and essential oil, compared to untreated controls. For the two reporting years, better results displayed the variants with a dose of annex 1.5 l/ha. Application of herbicide Raft 400 SC at concentrations 1.2 and 1.5 l/ha does not affect the qualitative composition of essential oil.

## **Instruction for authors**

### **Preparation of papers**

Papers shall be submitted at the editorial office typed on standard typing pages (A4, 30 lines per page, 62 characters per line). The editors recommend up to 15 pages for full research paper (including abstract references, tables, figures and other appendices)

**The manuscript** should be structured as follows: Title, Names of authors and affiliation address, Abstract, List of keywords, Introduction, Material and methods, Results, Discussion, Conclusion, Acknowledgements (if any), References, Tables, Figures.

**The title** needs to be as concise and informative about the nature of research. It should be written with small letter /bold, 14/ without any abbreviations.

### **Names and affiliation of authors**

The names of the authors should be presented from the initials of first names followed by the family names. The complete address and name of the institution should be stated next. The affiliation of authors are designated by different signs. For the author who is going to be corresponding by the editorial board and readers, an E-mail address and telephone number should be presented as footnote on the first page. Corresponding author is indicated with \*.

**Abstract** should be not more than 350 words. It should be clearly stated what new findings have been made in the course of research. Abbreviations and references to authors are inadmissible in the summary. It should be understandable without having read the paper and should be in one paragraph.

**Keywords:** Up to maximum of 5 keywords should be selected not repeating the title but giving the essence of study.

**The introduction** must answer the following questions: What is known and what is new on the studied issue? What necessitated the research problem, described in the paper? What is your hypothesis and goal?

**Material and methods:** The objects of research, organization of experiments, chemical analyses, statistical and other methods and conditions applied for the experiments should be described in detail. A criterion of sufficient information is to be

possible for others to repeat the experiment in order to verify results.

**Results** are presented in understandable tables and figures, accompanied by the statistical parameters needed for the evaluation. Data from tables and figures should not be repeated in the text.

**Tables** should be as simple and as few as possible. Each table should have its own explanatory title and to be typed on a separate page. They should be outside the main body of the text and an indication should be given where it should be inserted.

**Figures** should be sharp with good contrast and rendition. Graphic materials should be preferred. Photographs to be appropriate for printing. Illustrations are supplied in colour as an exception after special agreement with the editorial board and possible payment of extra costs. The figures are to be each in a single file and their location should be given within the text.

**Discussion:** The objective of this section is to indicate the scientific significance of the study. By comparing the results and conclusions of other scientists the contribution of the study for expanding or modifying existing knowledge is pointed out clearly and convincingly to the reader.

**Conclusion:** The most important consequences for the science and practice resulting from the conducted research should be summarized in a few sentences. The conclusions shouldn't be numbered and no new paragraphs be used. Contributions are the core of conclusions.

### **References:**

In the text, references should be cited as follows: single author: Sandberg (2002); two authors: Andersson and Georges (2004); more than two authors: Andersson et al.(2003). When several references are cited simultaneously, they should be ranked by chronological order e.g.: (Sandberg, 2002; Andersson et al., 2003; Andersson and Georges, 2004). References are arranged alphabetically by the name of the first author. If an author is cited more than once, first his individual publications are given ranked by year, then come publications with one co-author, two co-authors, etc. The names of authors, article and journal titles in the Cyrillic or alphabet different from Latin, should be transliterated into Latin and article titles should be translated into English. The original language of articles and books translated into English is indicated in

parenthesis after the bibliographic reference (Bulgarian = Bg, Russian = Ru, Serbian = Sr, if in the Cyrillic, Mongolian = Mo, Greek = Gr, Georgian = Geor., Japanese = Ja, Chinese = Ch, Arabic = Ar, etc.)

The following order in the reference list is recommended:

**Journal articles:** Author(s) surname and initials, year. Title. Full title of the journal, volume, pages. Example:

**Simm G, Lewis RM, Grundy B and Dingwall WS**, 2002. Responses to selection for lean growth in sheep. *Animal Science*, 74, 39-50

**Books:** Author(s) surname and initials, year. Title. Edition, name of publisher, place of publication. Example: **Oldenbroek JK**, 1999. *Genebanks and the conservation of farm animal genetic resources*, Second edition. DLO Institute for Animal Science and Health, Netherlands.

**Book chapter or conference proceedings:** Author(s) surname and initials, year. Title. In: Title of the book or of the proceedings followed by the editor(s), volume, pages. Name of publisher, place of publication. Example:

**Mauff G, Pulverer G, Operkuch W, Hummel K and Hidden C**, 1995. C3-variants and diverse phenotypes of unconverted and converted C3. In: *Provides of the Biological Fluids* (ed. H. Peters), vol. 22, 143-165, Pergamon Press. Oxford, UK.

**Todorov N and Mitev J**, 1995. Effect of level of feeding during dry period, and body condition score on reproductive performance in dairy cows, IX<sup>th</sup> International Conference on Production Diseases in Farm Animals, Sept.11 – 14, Berlin, Germany, p. 302 (Abstr.).

### **Thesis:**

**Penkov D**, 2008. Estimation of metabolic energy and true digestibility of amino acids of some feeds in experiments with muscovy duck (*Carina moschata*, L). Thesis for DSc. Agrarian University, Plovdiv, 314 pp.
